

HW12: Project number 2, page 635 in the textbook.

I have uploaded a file: Driver.java. Do not modify this file. Use it to validate the correctness of the two files you will create. The files you will create are PatientRecord.java and BadVisitDataException.java. You will not need any other files.

In Driver.java, the comment at the end of the file shows what should printout when the program is executed.

The parameters in the PatientRecord constructor are: a patient ID, month, day, year, reason for the visit, treatment

You will need a hashCode method in PatientRecord that will create, and return the hash code displayed in the printout.
